Event Triggering Distribution Specification Supplement (ETDSS)
29 January 2019
Event Triggering Distribution Specification Supplement (ETDSS)

29 January 2019
Preamble

This Event Triggering Distribution Specification Supplement (ETDSS) facilitates agreements between television broadcasting and distribution companies concerning in-band distribution of Event Triggering according to SCTE standards. The goal is to enable novel business models by means of support of applications. The ownership of the ETDSS resides with the Event Triggering Workgroup of the Dutch Media Perspectives Foundation, having its place of business in Hilversum, the Netherlands.

The participants of the Workgroup believe that harmonisation of the technologies in this document across Europe is desirable and are interested in hearing from other stakeholders who share this vision. It is an option to transfer the document to a suitable international organisation to support further standardisation and application.

Please contact Media Perspectives for feedback, questions, if you wish to contribute or if your organisation wants to use this document for its own use.

Except for branding and corporate design, this document contains no copyright. Media Perspectives accepts no liability however for any use of this document.

1 Introduction

This document is an extension to the Event Triggering Distribution Specification (ETDS). It supplies general information and describes several examples of Event Triggering messages that may be used by broadcast stations.

The purpose of Event Triggering is to allow applications and services downstream to support a variety of features. Examples of these features are, but are not limited to:

- National and targeted ad-replacement
- Trick play enabling
- Content blanking
- Archiving
- Video-on-Demand triggering
- Regional windowing
- Electronic Program Guide update provisioning
- Audio loudness measurements
- Broadcaster, Service and Program identification
- Regional windowing

More functionality can be added in the future, while using the same or added in-band information. The signalling can be applied in traditional linear broadcasting as well as in streaming video applications. The triggering can be extended with out-of-band metadata to provide more detailed information about a certain trigger, its identity and the corresponding action.

2 References

The in-band signalling complies with the following standards and recommendations:

ANSI/SCTE-104 2018 Automation System to Compression System Communications Applications Program Interface.
SMPTE ST20 10 2008 Vertical Ancillary Data Mapping of ANSI/SCTE-104 messages.
IETF RFC 4122 1998 Universally Unique Identifiers.
ETSI TS 101 231 v1.3.1 Television systems; Register of Country and Network Identification (CNI), Video Programming System (VPS) codes and Application codes for Teletext based systems.

3 Event triggering

3.1 Introduction

This section describes the generic application of Event Triggering at broadcast stations and television distribution companies.

3.2 Generation and distribution

Figure 1 shows generic examples of the signal flow between a broadcasting station and several methods of distribution. Signalling according to SCTE-104 is generated by the play-out automation at the broadcast station and is locally distributed via LAN. Alternatively, SCTE 104 signalling can be generated by an intermediate system that communicates with the play-out automation and the scheduling system. An embedder adds the signalling according to SMPTE ST2010 to the (HD)SDI output of the play-out system.

Three different imaginary distribution forms are displayed. From top to bottom:

1. Linear transmission encoded by the distributor combined with 'on-top-of-the-network' based delivery (OTT).
2. Linear transmission encoded by the broadcast station combined with OTT provided by the distributor.
3. OTT combined with third party access.

Distributors that process the (HD)SDI signal receive the signalling embedded as SCTE-104 messages. A DVB encoder converts the messages to SCTE-35 data, distributed in a dedicated DVB Packet Identifier (PID), individually per service and time-aligned combined with video, audio and other data of the television service. The SCTE-35 data can be decoded downstream for features as described in section 1.

Additional data about the events is sent by means of a separate path, also known as out-of-band communications. This data channel may occupy considerably more information than SCTE-35 messages themselves. One of the ways to send such information is described in SCTE-224, an Event Scheduling and Notification Interface. However, legacy systems such as EPG supply schemes can also be used as out-of-band communications for Event Triggering. Practice of this data channel is however out of scope of this specification.

In the outlined examples, SCTE-35 data serves as an input for OTT systems. Compatible with their characteristic encoding structure, this data is used to modify the manifest file. In case of ad-replacement, the manifest sequence points the media player frame accurately to the video stream of the alternative content, such as a commercial. There are several ways to control this process, such as ESAM, VAST or SCTE-130. These processes are however out of scope of this document.
Figure 1 – SCTE-104/35 signal flow examples
4 Format and timing

4.1 Introduction
In this section, the main structure of Event Triggering messages is described.

4.2 Splice commands
The SCTE-35 standard offers the opportunity to keep using traditional splice_insert() commands in order to stay backward compatible with older equipment. In this specification it is assumed that downstream applications are up to date. To avoid interference, all events are signalled using time_signal() messages only, enriched with segmentation descriptors.

4.3 Segmentation
According to the SCTE-104 and SCTE-35 standards, all individual broadcast events in the linear playlist can be signalled by use of segmentation descriptors. The event elements can be distinguished as follows:

<table>
<thead>
<tr>
<th>Segment</th>
<th>A uniquely identifiable broadcast playlist element such as a Program, a Chapter or an Interstitial.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Program</td>
<td>An individual, self-contained audio-visual item, not being an Interstitial.</td>
</tr>
<tr>
<td>Chapter</td>
<td>A part of a Program followed by one or more Interstitials or by the Chapter of another Program. Chapters are sequentially numbered per Program, starting at one within a given collection.</td>
</tr>
<tr>
<td>Break</td>
<td>A complete block of one or more Interstitials in advance of, interrupting or following up a Program. Breaks are sequentially numbered per Program. A Break in between two Programs can either:</td>
</tr>
<tr>
<td></td>
<td>• Belong to the first Program as a whole.</td>
</tr>
<tr>
<td></td>
<td>• Belong to the second Program as a whole.</td>
</tr>
<tr>
<td></td>
<td>• Belong to both Programs for a part.</td>
</tr>
<tr>
<td></td>
<td>Not belong to a Program and be considered standalone.</td>
</tr>
<tr>
<td>Advertisement</td>
<td>See Interstitial.</td>
</tr>
<tr>
<td>Interstitial</td>
<td>An individual, self-contained commercial, billboard, promotional (promo) or similar item, not being a Program. Interstitials are sequentially numbered per Break, starting at one within a given collection. The referenced version of SCTE-35 does not include a dedicated segmentation_type_id for promotional items or billboards. These Segments therefore need to be signalled as Advertisements.</td>
</tr>
</tbody>
</table>
Commercial  An individual, self-contained lucratively oriented Interstitial, not being a billboard, a promo or a similar item.

Provider Placement  A delineation of Segments such as a block of one or more Advertisements. There can be more than one Provider Placement present within one Break. A collection of Provider and Distributor Placements is sequentially numbered per Break. A Provider Placement can also be used to signal other events such as regional windows within the scheduling of a national TV network.

Distributor Placement  A block of one or more Provider Advertisements identified to be available for local replacement by one or more Distributor Advertisements. This arrangement is traditionally known as 'Avail'. There can be more than one Distributor Placement present within one Break. Placements may be specifically addressed to distributors, to other organisations or to the broadcaster itself. A collection of Provider and Distributor Placements is sequentially numbered per Break.

Signalling is performed using the segmentation_type_id values as defined in Table 8-8 of SCTE-35. The following values are expected to appear in pairs:

- Program Start/End
- Program Breakaway/Program Resumption
- Chapter Start/End
- Provider Advertisement Start/End
- Distributor Advertisement Start/End
- Break Start/End
- Provider Placement Opportunity Start/End
- Distributor Placement Opportunity Start/End
- Unscheduled Event Start/End
- Network Start/End

A Program End can be replaced by a Program Early Termination if necessary to signal an unexpected closing. A Program can also include a Breakaway (a Program in a Program) or a Resumption (a continuation of the previous Program after a Breakaway). These exceptions only apply if inserted between Program Start and Program End or between Program Start and Program Early Termination.

### 4.4 Identification

The SCTE-35 standard allows using segmentation_type_id and segmentation_upid descriptors to send identification of the transmitted content. According to this specification, the information is sent as:

- A general part A that contains the start and end triggers and the Airing ID UPID (Unique Program Identifier). Airing ID is one of the standard options registered in table 21 of SCTE-35 and represents a 64-bit integer value.
A specific part B transmitted as Managed Private Data. This data includes the Format Identifier as disclosed by the SMPTE Registration Authority which is meant to identify the broadcast organisation. Managed Private Data contains additional identification. It is also sent in messages that signal individual Interstitials in order to refer to the Program they run with.

**General part A:**

<table>
<thead>
<tr>
<th>Using segmentation_type_id</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>0x10</td>
<td>Program Start</td>
</tr>
<tr>
<td>0x11</td>
<td>Program End</td>
</tr>
<tr>
<td>0x12</td>
<td>Program Early Termination</td>
</tr>
<tr>
<td>0x13</td>
<td>Program Breakaway</td>
</tr>
<tr>
<td>0x14</td>
<td>Program Resumption</td>
</tr>
<tr>
<td>0x20</td>
<td>Chapter Start</td>
</tr>
<tr>
<td>0x21</td>
<td>Chapter End</td>
</tr>
<tr>
<td>0x22</td>
<td>Break Start</td>
</tr>
<tr>
<td>0x23</td>
<td>Break End</td>
</tr>
<tr>
<td>0x30</td>
<td>Provider Advertisement Start</td>
</tr>
<tr>
<td>0x31</td>
<td>Provider Advertisement End</td>
</tr>
<tr>
<td>0x32</td>
<td>Distributor Advertisement Start(^1)</td>
</tr>
<tr>
<td>0x33</td>
<td>Distributor Advertisement End</td>
</tr>
<tr>
<td>0x34</td>
<td>Provider Placement Opportunity Start</td>
</tr>
<tr>
<td>0x35</td>
<td>Provider Placement Opportunity End</td>
</tr>
<tr>
<td>0x36</td>
<td>Distributor Placement Opportunity Start</td>
</tr>
<tr>
<td>0x37</td>
<td>Distributor Placement Opportunity End</td>
</tr>
<tr>
<td>0x40</td>
<td>Unscheduled Event Start</td>
</tr>
<tr>
<td>0x41</td>
<td>Unscheduled Event End</td>
</tr>
<tr>
<td>0x50</td>
<td>Network Start</td>
</tr>
<tr>
<td>0x51</td>
<td>Network End</td>
</tr>
</tbody>
</table>

For a complete overview of segmentation_type_ids, see table 22 of SCTE-35.

<table>
<thead>
<tr>
<th>and segmentation_upid_type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>0x08</td>
<td>Airing ID</td>
</tr>
</tbody>
</table>

Uses a 64-bit unsigned numeric value Airing ID that uniquely identifies content such as a Program or an Interstitial, or delineation of a collection of Segments such as a Break or a Placement. In this specification, the Airing ID of the first Chapter carries the same value as its associated Program.

\(^1\) Distributor Advertisement Start and Distributor Advertisement End can be used in the distribution stage.
Specific part B:

<table>
<thead>
<tr>
<th>Field</th>
<th>Value/Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>segmentation_type_id</td>
<td>0x01 Content Identification</td>
<td>Uses a 32-bit string 'Format Identifier' representing the name of the broadcaster as disclosed by the SMPTE Registration Authority. In the examples in section 5, the name 'TVST' is used, referring to the imaginary broadcaster 'TV Station'.</td>
</tr>
<tr>
<td>segmentation_upid_type</td>
<td>0x0C Managed Private UPID</td>
<td></td>
</tr>
<tr>
<td>format_identifier</td>
<td></td>
<td></td>
</tr>
<tr>
<td>private_cni</td>
<td></td>
<td></td>
</tr>
<tr>
<td>private_version</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Additional identification</td>
<td></td>
<td></td>
</tr>
<tr>
<td>fields</td>
<td></td>
<td></td>
</tr>
<tr>
<td>private_file_id</td>
<td></td>
<td></td>
</tr>
<tr>
<td>private_registry_id</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

4.5 Heartbeat

The Heartbeat is an optional repetitive message type B as described in the previous section which can be used to monitor proper operation of the system. It includes Content Identification data which allows periodic signalling of the running content and allows quick recovery of the applications after a failure. Section 5.9 shows an example of the syntax. A proper frequency of the Heartbeat signal is around every 60 seconds, restarting its cycle at presence of other messages. The frequency can be changed according to necessity and capacity. Start and End messages always have priority above Heartbeats.
4.6 Timestamp

Scheduled messages shall contain a valid timestamp that points to the frame accurate start and end time of the event. To avoid undefined behaviour, a pre-roll time of 4 seconds is included in the message. There are nevertheless always situations where the start or end of a broadcast item must be signalled immediately instead of planned. This can be done by setting the time_type to 0 in SCTE-104 and the time_specified_flag to 0 in SCTE-35, which means that there is no time reference included in the message. A typical application is the end of a live event that is determined real-time. The consequence of using such an immediate command is that processes that make use of the triggering cannot be controlled with the usual timing accuracy. Organisations and applications that process the signalling shall be aware that this may happen and shall handle them in the best possible manner.

The timing reference is UTC. To achieve frame accurate timing, the Automation System generating the SCTE-104 messages must be able to configure a static time offset to compensate for any video delay between the play-out system and the embedder or the encoder. If the Automation System feeds the same message to more than one example, the same TV channel in HD and SD resolution – this time offset must be independently configurable to support different delays that may exist in the signal chain.

4.7 Command cancellation

Theoretically, an issued command can be updated by sending a new message with the correct or more accurate data or it can be cancelled by a message that has the segmentation_event_cancel_indicator_flag set to 1. This is however not supported in this specification.

4.8 Shared use of Placement Opportunity Starts

A collection of Placement Opportunity Ends that share the segmentation_event_id of one common Placement Opportunity Start is not supported in this specification.

4.9 Sample events

Figures 2 to 4 describe some sample events in further detail using the syntax of SCTE-104. The samples do not indicate a limitation; several combinations can be active at the same time if, for example, a Program is interrupted by more than one other Program (Program Breakaway). The yellow blocks include the segmentation_descriptor() values for the corresponding events. The messages also include Content Identification data as described as message type B in section 4.4.

Figure 5 shows an example of how segments are numbered using the fields segment_num, segment_expected, sub_segment_num and sub_segment_expected. Numbering is useful for error detection purposes. Its use is recommended but also optional in this specification.
Figure 2 – Event Triggering examples (Program/Commercial transitions and Avail)
Figure 3 – Event Triggering examples (Break delineation)
Figure 4 – Event Triggering examples (Program Early Termination and Program Breakaway)
Figure 5 – Event Triggering examples with corresponding segment numbering
5 Applied composition

5.1 Introduction

In order to verify the full syntax, this section shows examples of SCTE-104 and SCTE-35 segmentation descriptors which can support further deployment by, for example, software programmers of broadcasters, distributors and manufacturers. The following imaginary transmission events can be distinguished. Numbers are formatted as unsigned integers. Information between quotes is formatted as ASCII text.

<table>

<th>Explanation</th>
</tr>
</thead>
<tbody>
<tr>
<td>splice_time()</td>
<td></td>
<td>{</td>
</tr>
<tr>
<td></td>
<td></td>
<td>time_specified_flag = 1                                                                         1 Indicates that a timestamp is included in the message.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>reserved                                                                                                                                   6 Fills up the remaining byte.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>pts_time                                                                                                                                   33 Time in 90 kHz clock ticks that represents the intended splice point. This value may have an offset defined by the field 'pts_adjustment' in the 'splice_info_section' of the message.</td>
</tr>
<tr>
<td>}</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

## 5.3 Base message – Immediate

The following syntax is used in every immediate start message that contains one or more segmentation descriptors. Only fields that require a specific value in this specification are listed below. For other fields of the descriptor, please consult the SCTE standards.

### 5.3.1 Message composition SCTE-104

<table>
<thead>
<tr>
<th>Syntax SCTE-104</th>
<th>Bytes</th>
<th>Explanation</th>
</tr>
</thead>
<tbody>
<tr>
<td>multiple_operation_message()</td>

}
```

1. **sub_segments_expected = 0**
   - **Bytes:** 1
   - **Explanation:** Not used.

2. **segmentation_event_id**
   - **Bytes:** 4
   - **Explanation:** A unique segmentation event identifier. The same number is used for the related Program End message.

3. **segmentation_event_cancel_indicator = 0**
   - **Bytes:** 1
   - **Explanation:** No cancellation.

4. **duration = 1231**
   - **Bytes:** 2
   - **Explanation:** Duration of the whole Program in seconds, including assigned Breaks. This field shall be 0 if the expected duration is not known.

5. **segmentation_upid_type = 0x08**
   - **Bytes:** 1
   - **Explanation:** Airing ID.

6. **segmentation_upid_length = 8**
   - **Bytes:** 1
   - **Explanation:** Length of the UPID in bytes.

7. **segmentation_upid() = 2699312669362**
   - **Bytes:** 8
   - **Explanation:** Uniquely identifies 'Program 2'.

8. **segmentation_type_id = 0x10**
   - **Bytes:** 1
   - **Explanation:** Program Start.

9. **segment_num = 1**
   - **Bytes:** 1
   - **Explanation:** This field is set to 1 in Program messages.

10. **segments_expected = 1**
    - **Bytes:** 1
    - **Explanation:** This field is set to 1 in Program messages.

11. **duration_extension_frames = 2**
    - **Bytes:** 1
    - **Explanation:** The total length of the Program is duration in seconds plus duration_extension_frames.

12. **delivery_not_restricted_flag = 1**
    - **Bytes:** 1
    - **Explanation:** This field is set to 1 which means that the delivery restriction flags and field are not used.

13. **web_delivery_allowed_flag = 1**
    - **Bytes:** 1
    - **Explanation:** Not used.

14. **no_regional_blackout_flag = 1**
    - **Bytes:** 1
    - **Explanation:** Not used.

15. **archive_allowed_flag = 1**
    - **Bytes:** 1
    - **Explanation:** Not used.

16. **device_restrictions = 0**
    - **Bytes:** 1
    - **Explanation:** Not used.

17. **insert_sub_segment_info = 0**
    - **Bytes:** 1
    - **Explanation:** The descriptor does not contain sub-segment numbering.

```

**segmentation_upid_type = 0x08**

1 **Airing ID.**

**segmentation_upid_length = 8**

1 Length of the UPID in bytes.

**segmentation_upid() = 2699312669362**

8 Uniquely identifies 'Program 2 – Chapter 1'.

**segmentation_type_id = 0x20**

1 **Chapter Start.**

1 First Chapter within the running Program.

1 A total of 3 Chapters is expected.

1 The total length of the Chapter is duration in seconds plus duration_extension_frames.

1 This field is set to 1 which means that the delivery restriction flags and field are not used.

1 Not used.

1 Not used.

1 Not used.

1 Not used.

1 The descriptor does not contain sub-segment numbering.

```

### Explanation
- **segmentation_event_id**: A unique segmentation event identifier. The same number is used for the related Break End message.
- **segmentation_event_cancel_indicator = 0**: No cancellation.
- **duration = 312**: Duration of 'Break 1' in seconds. This field is set to 0 if the duration is not known.
- **segmentation_upid_type = 0x08**: Airing ID.
- **segmentation_upid_length = 8**: Length of the UPID in bytes.
- **segmentation_upid() = 7499310032125**: Uniquely identifies 'Break 1'.
- **segmentation_type_id = 0x22**: Break Start.
- **segment_num = 1**: First Break associated with the running Program.
- **segments_expected = 5**: A total of 5 Breaks associated with the running Program is expected.
- **duration_extension_frames = 12**: The total length of the Break is duration in seconds plus duration_extension_frames.
- **delivery_not_restricted_flag = 1**: This field is set to 1 which means that the delivery restriction flags and field are not used.

    segmentation_type_id = 0x30
    segment_num = 1
    segments_expected = 1
    duration_extension_frames = 7

    A unique segmentation event identifier. The same number is used for the related Provider Advertisement End message.

    No cancellation.

    Duration of 'Commercial 1' in seconds. This field is set to 0 if the duration is not known.

    Airing ID.

    Length of the UPID in bytes.

    Uniquely identifies 'Commercial 1'.

    Provider Advertisement Start.

    First Interstitial within the Break.

    One Interstitial is expected in the Break.

    The total length of the Interstitial is duration in seconds plus duration_extension_frames.

5.7 Distributor Placement Opportunity Start

The following example specifies the syntax transmitted at the end of ‘Commercial 1’ and the start of ‘Commercial 2’ which is available to be replaced by the distributor. This is indicated by the start of a Distributor Placement Opportunity, also known as Avail.

5.7.1 Message composition SCTE-104

</tbody>
</table>

```c
insert_segmentation_descriptor_request_data()
{
  segmentation_event_id
  segmentation_event_cancel_indicator = 0
  duration = 45
  segmentation_upid_type = 0x08
  segmentation_upid_length = 8
  segmentation_upid() = 5720992718833
  segmentation_type_id = 0x36
  segment_num = 1
  segments_expected = 5
  duration_extension_frames = 22
  delivery_not_restricted_flag = 1
}
```

- **segmentation_event_id**: 4 bytes. A unique segmentation event identifier. The same number is used for the related Distributor Placement Opportunity End message.
- **segmentation_event_cancel_indicator = 0**: 1 byte. No cancellation.
- **duration = 45**: 2 bytes. Duration of the Distributor Placement in seconds. This field is set to 0 if the duration is not known.
- **segmentation_upid_type = 0x08**: 1 byte. Airing ID.
- **segmentation_upid_length = 8**: 1 byte. Length of the UPID in bytes.
- **segmentation_upid() = 5720992718833**: 8 bytes. Uniquely identifies 'Distributor Placement Opportunity 1'.
- **segmentation_type_id = 0x36**: 1 byte. Distributor Placement Opportunity Start.
- **segment_num = 1**: 1 byte. First Break associated with the running Program.
- **segments_expected = 5**: 1 byte. A total of 5 Breaks associated with the running Program is expected.
- **duration_extension_frames = 22**: 1 byte. The total length of the Placement is duration in seconds plus duration_extension_frames.
- **delivery_not_restricted_flag = 1**: 1 byte. This field is set to 1 which means that the delivery restriction flags and field are not used.

5.8 Distributor Placement Opportunity End

The following example specifies the syntax transmitted at the end of 'Commercial 2' which was available to be replaced by the distributor. This is indicated by the end of the Distributor Placement Opportunity, also known as Avail. The message also signals the start of 'Commercial 3'.

![Diagram showing time line with Commercial 2 and Commercial 3]

#### Explanation
- **splice_descriptor_tag = 0x02**: Defines the body of the descriptor.
- **descriptor_length = 28**: The length of the descriptor in bytes.
- **identifier = 'CUEI'**: Identifies the descriptor.
- **segmentation_event_id**: A unique segmentation event identifier. The same number is used for the related Provider Advertisement End message.
- **segmentation_event_cancel_indicator = 0**: No cancellation.
- **reserved**: Fills up the remaining byte.
- **program_segmentation_flag = 1**: All PIDs of the program are to be segmented.
- **segmentation_duration_flag = 1**: Duration is specified.
- **delivery_not_restricted_flag = 1**: This field is set to 1 which means that the delivery restriction flags and field are not used.
- **reserved**: Fills up the remaining byte.
- **segmentation_duration =**: Duration of 'Commercial 3' in 90 kHz clock ticks. This field is set to 0 if the duration is not known.
- **segmentation_upid_type = 0x08**: Airing ID.
- **segmentation_upid_length = 8**: Length of the UPID in bytes.
- **segmentation_upid() = 7319263374901**: Uniquely identifies 'Commercial 3'.
- **segmentation_type_id = 0x30**: Provider Advertisement Start.
- **segment_num = 3**: Third Interstitial within the Break.
- **segments_expected = 3**: A total of 3 Interstitials is expected in the Break.

6 Operator specific identifiers

6.1 Introduction

This section specifies additional Program identification, if relevant, for each participating organisation. The operators are listed in alphabetic order.

6.2 RTL Netherlands

Contact person: Hank van de Loo

6.2.1 Airing ID

The Airing ID corresponds to the following identifiers:

- Program: Event ID
- Chapters: Event ID
- Interstitials: Event ID
- Breaks: Break ID
- Provider Placements: Placement ID
- Distributor Placements: Placement ID
- Network Start/End: Network Start/End ID
